GreenTrans at Test IT Track in Taipei

GreenTrans e-bikes with the GreenTrans Power Kit are part of the ExtraEnergy Test IT Track at Taipei International Cycle Show 2013. "When customers first ride on the GreenTrans kit e-bike, they are very surprised on the instant and strong assisted power output, the noise of motor is so low, while the booster will not be intermittent paused with the rotation of the pedaling. Especially when climbing uphill, the rider can be easily uphill almost without strong step", informs the company.

GreenTrans Rear-Wheel Driving Motor

GreenTrans rear-wheel driving motor is with power regeneration function. As long as the display is set on regeneration mode, the motor will convert and restore energy back to battery, the electric capacity of battery is extended accordingly. The special advantage is more applicable to sports e-bike.

Suitable for E-MTB, E-Trekking Bike and Sports E-Bike

GreenTrans has developed 36V and 48V kit systems, which provide multiple choices to customers, they are suitable for e-MTB, e-Trekking bike and sports e-bike. Besides, GreenTrans also showcases the newly developed central motor with embedded GreenTrans torque sensor and with more power output.

New E-bikes in 2013

GreenTrans is aiming to launch new e-bikes on the market in 2013.

ropa engineering - EnergyBus compliant Electric Drive Unit

The ropa pedelec drive unifies the advantages of a mid-engine with the preferences of a wheel hub motor through combining electro drive, crank drive and electronic gear. This gives engineers the ability to drop the mostly overcharged standard bike parts like hifts, shift cables, controlling components and the mechanical back wheel brake. Because of this overcharging problem they are often the limiting factor. Additionally, there is a high documentation and communication level between motor control, battery, charger, control panel, mobile devices, software applications and server systems.
